

Project Documentation

B2B Marketplace Platform

Verified supplier directory · RFQ & quotation engine · Credit economy

Prepared for: Client

Date: June 2026

Status: **All core features delivered & build-verified**

Executive Summary

BigSeaa is a production-grade B2B marketplace that connects verified suppliers with buyers worldwide. Buyers discover suppliers and products with localized pricing, post Requests for Quotation (RFQs), and receive competitive quotes — using credits to unlock supplier contacts. Suppliers list products, respond to RFQs, and become verified. Administrators moderate the entire platform.

The platform is built on a modern, SEO-first, fully type-safe technology stack and is delivered as a complete, build-verified application across three surfaces:

- **Public website** — fast, search-engine-optimized pages that bring in organic buyers.
- **Member dashboards** — dedicated workspaces for buyers and suppliers.
- **Admin panel** — full moderation, verification and content management.

42	Pages / screens	3	User roles
59	Delivered features	8	Delivery phases (complete)

What's Delivered

Surface	Highlights
Public Website	Animated home (3D hero), supplier directory & profiles, product catalog with advanced filters and multi-currency pricing, category system, FAQs, content pages, full SEO.
Buyer Dashboard	Post & manage RFQs, receive and accept/reject quotations, buy & spend credits, unlock supplier contacts, save items, notifications, profile & security settings.
Supplier Dashboard	Browse the RFQ feed and submit quotes, full product management, company profile, and document-based verification.
Admin Panel	User management with approve/block/impersonate, supplier verification queue, RFQ moderation, category/CMS/FAQ management, credit administration, and a full audit trail.

Feature Highlights

Buyer experience

- Post a Request for Quotation in minutes and manage it end-to-end.
- Compare quotations side by side and accept the best — suppliers are notified instantly.
- Unlock verified supplier contacts using a transparent credit system.
- Save suppliers, products and RFQs; manage notification preferences.

Supplier experience

- Discover relevant buyer requests in a live RFQ feed and submit competitive quotes.
- Maintain a full product catalog and a rich, public company profile.
- Build trust through document-based verification and a verified badge.

Administration & trust

- Approve, reject or block users; securely impersonate accounts for support.
- Review supplier documents and grant verified status.
- Moderate spam, manage categories, content pages, FAQs and credits.
- Every administrative action is recorded in an audit log.

Growth & discovery

- Search-engine-optimized pages (structured data, sitemaps) to attract organic buyers.
- Country-based pricing and currency conversion for a global audience.
- Multi-channel notifications: in-app, email, SMS, WhatsApp and Telegram.

Technology Stack

A modern, widely-adopted, all-TypeScript stack chosen for SEO, reliability and scale.

Area	Technology	Why
Framework	Next.js 16 / React 19	SEO-friendly server rendering; one full-stack codebase
Language	TypeScript	Type safety across the whole application
Database	PostgreSQL + Prisma	Reliable relational data; type-safe access
Authentication	Auth.js (NextAuth)	Email, Google SSO, roles, admin impersonation
UI / Design	Tailwind CSS + shadcn/ui	Custom, accessible, modern interface
Experience	GSAP · Three.js · Lenis	Premium animation, 3D and smooth scrolling
Payments	Stripe	Secure credit-pack checkout

Area	Technology	Why
Messaging	Resend · Twilio · Telegram	Email, SMS, WhatsApp and Telegram notifications
Storage	Cloudflare R2 / S3	Documents and media
Hosting	Any Node.js host	Deploys to Railway, Render, DigitalOcean, AWS, VPS...

How It Works

The buyer → supplier loop

- 1. A buyer posts an RFQ describing what they need.
- 2. Verified suppliers see it in their feed and submit quotations.
- 3. The buyer compares quotes and accepts one — the supplier is notified and others are declined.
- 4. The buyer unlocks the supplier's contact details with credits to finalize the deal.

Trust & verification

- Suppliers submit company documents which administrators review.
- Approved suppliers receive a verified badge shown across the marketplace.
- Spam protection and moderation keep the platform clean.

Quality, Security & SEO

Area	What's in place
Security	Role-based access control, input validation, password hashing, transaction-safe credits, secure payment webhooks, audit logging.
SEO	Server-rendered pages, rich structured data (products, organizations, FAQs, breadcrumbs), dynamic sitemap and clean keyword-rich URLs.
Reliability	Fully type-safe code, atomic database transactions, and a verified production build.
Performance	Optimized images and fonts, server streaming, and edge-cacheable pages.

Delivery Phases

Phase	Scope	Status
0 — Foundation	Setup, database, design system, authentication base	Completed
1 — Public Site	Listings, details, categories, filters, currency, SEO	Completed
2 — Authentication	Login, registration, Google SSO, supplier onboarding	Completed
3 — Buyer Dashboard	RFQs, quotations, saved items, credits, profile	Completed
4 — Supplier Dashboard	RFQ feed, quotes, products, company, verification	Completed
5 — Payments & Credits	Unlock flow, Stripe checkout, credit packs	Completed

Phase	Scope	Status
6 — Admin Panel	Users, verification, CMS, FAQ, categories, credits	Completed
7 — Notifications & Polish	Notification center, final polish, documentation	Completed

Deployment & Handoff

The application is a standard Next.js project and can be deployed to any Node.js hosting provider (e.g. Railway, Render, DigitalOcean, AWS) or via Docker. To go live it needs:

- A managed PostgreSQL database connection.
- Environment configuration (provided template).
- Optional service keys to activate live payments, email and SMS (Stripe, Resend, Twilio).

Until those keys are added, payments are simulated and notifications are logged, so the full product can be demonstrated immediately.

All core functionality is complete and verified. The platform is ready for demonstration and for production deployment.
